

Swapnil Jain

Noida, India | +91 6397834087 | swapniljain5114@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

Education

Bennett University

B.Tech in Computer Science Engineering
GPA: 8.4 / 10

Uttar Pradesh, India
2022 - 2026

Experience

Software Development Intern

Jan 2026 - Present

AFI Digital Services LLP

- Followed Agile (Scrum) methodology with bi-weekly sprints and PR-based code reviews; validated Razorpay webhook flows with mock payloads (HMAC-SHA256) and wrote Postman collection-based automated regression tests across all service endpoints.
- Architected a scalable, multi-tiered LMS on the MERN stack, separating auth, content delivery, progress tracking, and payment service layers - improving course management efficiency by 40% and enabling independent scaling of each tier.
- Orchestrated robust request logging and error-tracing middleware within Node.js, ensuring full observability across API tiers; correlated request lifecycles across critical services, cutting down mean time to resolution for production incidents by 30%.
- Engineered a pluggable live class SDK using the Strategy design pattern supporting Dyte, Zoom, Google Meet, and MS Teams via a unified provider interface with OAuth2 and MS Graph API auth - enabling zero-frontend-change provider switching.

Projects

Artha.ai - AI-Powered Pre-Trade Analysis Platform ([Live Link](#))

Jan 2026 - Present

Next.js · FastAPI (Python) · APScheduler · Google Gemini · Kite Connect · SQLite (PostgreSQL-ready)

- Designed and built a multi-tiered market intelligence platform with a Next.js frontend, integrating 5 heterogeneous data sources (Zerodha Kite Connect, NSE India, Finnhub, FMP, Screener.in) behind a unified async FastAPI backend with a PostgreSQL-ready relational schema - implementing an NSE -> Kite -> yfinance fallback chain for 99% data availability.
- Engineered an async scheduled pipeline using APScheduler (AsyncIOScheduler) to generate a 7-section AI morning brief at 8:00 AM IST on market days - aggregating FII/DII flows, index snapshots, and sector cues via Google Gemini, with a 6-hour fundamentals cache refresh cycle.
- Spearheaded the creation of a trade signal engine, incorporating sentiment analysis and risk thresholds, to deliver GO/CAUTION/AVOID recommendations, decreasing portfolio drawdowns in backtests by 7%.
- Developed a Chrome Extension (Manifest V3) that intercepts the Zerodha Kite order flow and surfaces real-time pre-trade risk analysis inline - private repo, code available on request.

Job Application Multi-Agent Pipeline ([GitHub](#))

2026 - Present

Python · LangGraph · Claude API · Google Sheets API · Firecrawl · Hunter.io API

- Architecting an end-to-end multi-agent job application pipeline: a LangGraph-orchestrated graph coordinating lead sourcing, Claude-powered resume tailoring and outreach drafting, a human-in-the-loop review checkpoint, and a cyclic follow-up-tracking node (architecture designed; tailoring, outreach, and orchestration in active development).
- Built a multi-source lead-sourcing pipeline aggregating job postings from structured REST APIs (Arbeithnow, Jobicy) and unstructured company career pages via Firecrawl-based content extraction, normalized into a single deduplicated schema.
- Designed a Google Sheets-backed data layer (gsread + service-account auth) with dedupe logic preventing duplicate lead ingestion across repeated scrape runs.
- Integrated a third-party X/Twitter API for hiring-signal lead discovery and built a keyword-based relevance filter (role, seniority, experience-threshold matching) to auto-exclude out-of-scope leads.
- Implemented a contact-discovery skill using Hunter.io's Domain Search API with multi-path domain resolution to enrich leads with verified contact emails.

Technical Skills

Frontend: React.js, Next.js, Redux, Tailwind CSS, EJS

Backend: REST APIs, MVC, Node.js, Express.js, FastAPI, WebSockets, Middleware, MERN

Databases: SQLite / PostgreSQL-ready schema, MongoDB (NoSQL), Supabase, SQL

Cloud & DevOps: Git, GitHub, Postman, Agile / Scrum, AWS (Basic - EC2, S3), APScheduler

Languages: JavaScript (ES6+), Python, C++, SQL, HTML/CSS

Auth & Payments: JWT, OAuth2, MS Graph API, Razorpay Webhooks (HMAC-SHA256), Kite Connect API

Observability: Structured logging, request tracing middleware, async scheduled pipelines, fallback chain design, threshold-based alerting

DSA: LeetCode Rating 1679, Top 15% globally, 160+ problems solved in C++
